SYMPTOM CHECKER

Introduction

The Symptom Checker is an intelligent Python-based application designed to assist users in identifying possible health conditions based on the symptoms they input.

Functionality

By analyzing user-provided data through logical rules and structured datasets, the system suggests potential illnesses along with basic guidance, helping users make informed decisions about seeking medical advice.

Key Features

- Accuracy
- Simplicity
- Accessibility
- User-friendly interface

Applications

The application enables preliminary health assessment, making it faster and more convenient while promoting healthcare awareness.

Technical Implementation

This project highlights how Python can be used to build practical, real-world tools that support healthcare awareness and decision-making. The project uses functions like input() to collect symptoms and if-else conditions for decision-making.
